APPLICANT: GATY L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/08/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 890
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 170, Application US/08961527
Patent No. 6420135
GENERAL INFORMATION:
APPLICANT: Charles Kunsch
TITLE OF INVENTION: Streptococcus pneumoniae Polynucleotides and Sequences NUMBER OF SEQUENCES: 391
CORRESPONDENCE ADDRESS:
ADDRESSEE: Human Genome Sciences, Inc.
STREET: 9410 Key West Avenue
CITY: Rockville
STATE: Maryland
                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Patent No. 6699703

GENERAL INFORMATION:

TITLE OF INVENTION: Determined and Amino Acid Sequences Relating to Streptococcus

TITLE OF INVENTION: Preumoniae for Diagnostics and Therapeutics

TITLE OF INVENTION: Preumoniae for Diagnostics and Therapeutics

TITLE OF INVENTION: PartHO0-07A

CURRENT APPLICATION NUMBER: US/09/583,110

CURRENT FILING DATE: 1998-06-30

PRIOR PILING DATE: 1998-06-30

PRIOR APPLICATION NUMBER: US 60/085,131

PRIOR APPLICATION NUMBER: US 60/085,131

PRIOR PILING DATE: 1998-05-12

NUMBER OF SEQ ID NOS: 5322

LENGTH: 906

Sequence 5948, Application US/09270767

Factorice 5948, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

APPLICANT: Homburger et al.

TILLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster;

FILE REFERENCE: File Reference: 7326-094

CURRENT PAPLICANION NUMBER: US/09/270,767

CURRENT FILIG DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE PATENTIN Ver. 2.0

SEQ ID NO 5948
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                 Gaps

Sequence 34579, Application US/09513999C

Patent No. 6783611

Patent No. 6783611

APPLICANT: DWAGERT, A.

APPLICANT: DWAGERT, A.

ITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

PAPEL REFERENCE: 59.032.REG

CURRENT APPLICATION NUMBER: US/09/513,999C

CURRENT FILING DATE: 1090-02.24

PRIOR FILING DATE: 1099-02.26

NUMBER OF SEQ ID NOS: 36681

GENERAL INFORMATION:

TITLE OF INVENTION: UNCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS

TITLE OF INVENTION: UNMBER: US/09/134,001C

TITLE OF INVENTION: UNMBER: US/09/134,001C

CURRENT FILING DATE: 1997-10-08

PRIOR APPLICATION NUMBER: US 60/064,964

PRIOR APPLICATION NUMBER: US 60/064,964

PRIOR APPLICATION NUMBER: US 60/055,779

PRIOR FILING DATE: 1997-08-14

SEQ ID NOS: 5674

LENGTH: 192
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 22

Patent No. 6703492
GENERAL INFORMATION
TITLE OF INVENTION: STAPHYLOCOCCUS EPIDERMIDIS NUCLEIC ACIDS AND PROTEINS
TITLE OF INVENTION: STAPHYLOCOCCUS EPIDERMIDIS NUCLEIC ACIDS AND PROTEINS
FILE REPERENCE: PU3480US
CURRENT FILING DATE: 2000-11-09
PRIOR PAPLICATION NUMBER: 60/164,258
PRIOR PLEATION DATE: 1999-11-09
NUMBER OF SEQ ID NOS: 4472
SOFTWARE: patentin Ver. 2.1
SEQ ID NO 4298
LENGTH: 3446
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 3640, Application US/09710279

Facent No. 6750046

GENERAL INFORMATION:

APPLICANT: MOLONEN, MAURICE M.

APPLICANT: DALMIA, BIPIN K.

ITILE OF INVENTION: PREPARATION OF THIOREDOXIN REDUCTASE

ITILE OF INVENTION: PROTEINS ON OIL BODIES

FILE REFERENCE: 034547/0106

CURRENT APPLICATION NUMBER: US/09/897,425

CURRENT APPLICATION NUMBER: 09/210,843

The sequence contained an oligo-dT track that was present in the oligo-drouglectide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the Not1 site and the oligo-dT track served to identify it as a clone from the normalized ventricle at 15 dpc library cDNA Library Preparation:
M.B. Soares Lab Clone distibution: Glones will be available through Research Genetics (www.resgen.com) The following repetitive elements were found in this cDNA sequence: 223-300,
Seq primer: M13 Forward
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /nctoe="Vector: pr7730-Pac (Pharmacia) with a modified polylinker; Site 1: Not I; Site 2: Eco RI; The UI-R-BJZ library is a subfracted library derived from the following tissues: heart, atrium at 15 dpc, ventricle at 16.5 dpc, tissues: heart, atrium at 15 dpc, ventricle at 15.6 dpc, dpc, AV canal at 15 dpc. For a detailed description of the library from which this clone was derived, please visit our web site at retest-engy ulowa-edu. The subtraction has been previously described in (Bonaldo, Lennon and Soares, Genome Research 6:791-806, 1996) TAG_IIB-UI-R-BJZ

Single pass sequencing. Bases called with phred v0.020425.c and
trimmed with the aid of the trim_alt option. Vector identified by cross match v0.990329.
Seq primer: AGCGGATAACAATTCACACAGGA.

Seq primer: AGCGGATAACAATTCACACAGGA.
                                                                                                                                                     (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pward (gil 4722114 [gb] AF129072.1], a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Clones are derived from the bovine BAC library CHORI-240
(http://www.chori.org/bacpac/bovine240.htm). For BAC library
availability, please contact Pieter de Jong (pdejong@mail.cho.org).
Clones may be purchased from BACPAC Resources
(http://www.chori.org/bacpac/ordering_information.htm). This work
was undertaen as part of the International Bovine BAC Mapping
Consortium (IBBMC) by CSIRO Livestock Industries, Australia and the
British Columbia Genome Sciences Centre, Canada.

// Clone_Ither; Site_1: NOT I; Site_2: Eco RI; lst strand cDNA was prepared from human tonsillar cells enriched for germinal center B cells by flow sorting (CD20+, IgD-), provided by Dr. Louis M. Staudt (NCI), Dr. David Allman (NCI) and Dr. Gerald Marti (CESR). CDNA synthesis was primed with a Not I - oligo(dT) primer
// Startanded cDNA was ligated to Eco RI adaptors // Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. Library went through one round of normalization, and was constructed by Bento Soares and M. Fatima Bonaldo."

/clone lib="Sugano mouse kidney mkia"
/clone lib="Sugano mouse kidney mkia"
/note="Organ: kidney; Vector: pME188-FL3; Site_1: DraIII
(CACTGTGTG); Site_2: braiII (CACCATGTG); ist strand cDNA
was primed with an oligo(dT) primer
[ATGTGGCCTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [IGTTGGCCTACTGG], digested
and cloned into distinct DraIII sites of the pME188-FL3
vector (5' site CACTGTGTG, 3' site CACCATGTG). XhoI should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGATAAGGTGCG and 3' end
primer CGACCTGCAGCACA."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /organism="Strongylocentrotus purpuratus"

```

The invention provides a method for detecting a polymorphism linked to a gene associated with familial dysautonomia (FD). This involves detecting a disruptive mutation in a gene encoding the IkappaB kinase-complex.

a sociated protein (IKAP) on chromosome gdil. StappaB kinase-complex.

C Examilito in position of the donor splice site of intron 20.

This mutation (2507+6T to C) results in the generation of an IKAP mRNA in which exon 20 is spliced out along with intron 20. Sequence analysis of the IKAP gene of individuals heteroxygous for the FO foromosome with the most common minor haplotype (minor 2) showed a G to C transversion of not succeed in a splice of interpretation of a consensus Ser/Thr of succeeding usbetitution and disruption of a consensus Ser/Thr kinase phosphorylation site. The present sequence is a primer that can be used in a claimed method for detecting a disruptive mutation in the IKAP consensus services in a claimed method for detecting a disruptive mutation in the IKAP consensus homosygous for the major soft in a family with the primer was used in the genotype analysis of FD alleles. Use with the probands homosygous for the major haplotype, all affected individuals content and the proband were heteroxygous for the major and minor 2 FD content and the proband were heteroxygous for the major for the major for the major for the major for the probands were homozygous for the major for the major for the probands were heteroxygous for the major for the major for the probands were heteroxygous for the major for the probands were heteroxygous for the major for c mutation. Study content probands were homozygous for the major for pakenasi descent revealed the presence of 25 carriers of 2507+6T to C and 2 individuals with R096P content presence of 25 carriers of 2507+6T to C and 2 individuals with R096P content in the presence of 25 carriers of 2507+6T to C and 2 individuals with R096P contents were deteroxygous for the presence of 25 carriers of 2507+6T to C and 2 individuals with probands were detero
